Q: Create Widget with Object data? I have created a Widget class in Java and added an object called Stepper to it. However, when I add it to a JPanel, it just shows a blank widget. I have tried everything I could possibly think of, even finding ways to print the object's getValue(), but the widget is not printing anything to the JPanel. I've tested this out by using a regular JTextArea in the place of the widget, and that worked fine. I've even tried adding the object to a JScrollPane and that worked fine. This is a pretty basic widget, with only a single method. I really have no idea what I'm doing wrong, so any help is appreciated.

A: Creating a new JPanel won't do anything to the screen. You have to add your JPanel to a JFrame or J a1d647c40b
